

Project Report: Marketing Campaign A/B Testing

Objective: To determine if a "Conversion" focused campaign significantly outperforms a baseline "Awareness" campaign using statistical validation.

1. Data Overview

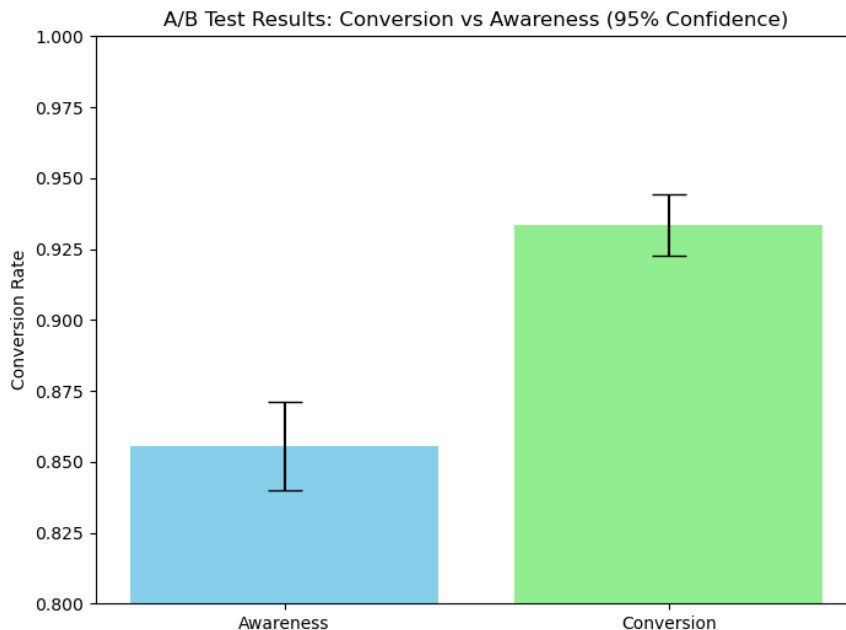

Analyzed 4,065 customer records across two campaign types: Awareness (1,988 users) and Conversion (2,077 users).

2. Key Findings

Awareness campaign conversion rate: 85.6%

Conversion campaign conversion rate: 93.4%

Difference: 7.8 percentage points (9.1% relative lift)

3. Statistical Significance

A Z-test for proportions gave a p-value below 0.001 ($Z = -8.12$). We reject the null hypothesis of no difference between the two campaigns: the gap is very unlikely to be random chance.

4. Business Recommendation

The Conversion campaign type performed significantly better in this data, so it should be prioritized. This compares campaign types in an existing dataset; it is not a randomized experiment, and campaign costs were not analyzed. A controlled test would confirm the result before large budget changes.
